Python For Beginners

Lab Exercise 9

1. We will create a class that calculates a person's payroll.

> Pass in their information, which includes:
>
> -Name
> -How much they earn per hour
> -How many hours they have worked that week.

This will then generate a value, which we will output.

2. Also, create an optional method that will note whether they worked overtime. If they did, they get time-and-a-half pay for the hours they worked overtime.

3. After all of this:

> A. Print out their name, how many normal hours they work at what wage, and how much money earned for that.
> B. Then another printout for over time.
> C. Finally, a printout of the total for both added together.
